Patient Meal Ordering

The Solution

We combine mobile data collection software from MobileFrame with key mobile devices from Honeywell to deliver an integrated patient meal ordering solution. We improve patient satisfaction with an easy to use interface and help ensure the right nutritional choices appear for your patients.

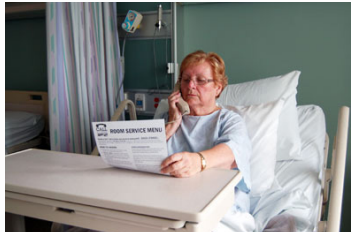

Electronic Patient Meal Ordering

Driving efficiency and patient satisfaction is the goal. Your meal planners can easily set food choices for the day through a central interface, selecting the available times, and any special dietary attributes of the selected food item. When the system is integrated with patient nutritional requirements, patients will only see the choices that are valid for their particular needs. Gone are the days of manually creating paper menus for manual distribution across the facility. Ensure your patients are properly set for their dietary restrictions, and avoid rework and kitchen delivery errors.

Technology

MobileFrame is a code-free, platform-agnostic, rapid application development platform optimized for mobile devices. Integrate with existing devices and room control systems, or deploy new with great devices from Honeywell. MobileFrame integrates with leading ERP and Business Management applications to provide a means of easily extending your core applications to replace formerly paper-based processes.

Key Benefits

- Increase patient satisfaction by 25%, improving your medicare percentage, an important part of the federal health care law.
- Improved Nutritional Care - patients get access to the menu based on their case file. Also reduces time spent developing each type of menu.
- Online ordering gives kitchen staff a strong early view of meal choices, enabling them to adjust menus and ordering options on the fly.
- Integration with business applications & food and beverage management software
